Key Risks

There is no assurance that a portfolio will achieve its investment objective or will work under all market conditions. The value of investments may go down as well as up and you may not get back the amount originally invested. Portfolios may be subject to certain additional risks, which should be considered carefully along with their investment objectives and fees.

- ◆ **Alternatives Risk:** There are additional risks associated with specific alternative investments within the portfolios; these investments may be less readily realisable than others and it may therefore be difficult to sell in a timely manner at a reasonable price or to obtain reliable information about their value; there may also be greater potential for significant price movements.
- ◆ **Equity risk:** Portfolios that invest in securities listed on a stock exchange or market could be affected by general changes in the stock market. The value of investments can go down as well as up due to equity markets movements.
- ◆ **Interest rate risk:** As interest rates rise debt securities will fall in value. The value of debt is inversely proportional to interest rate movements.
- ◆ **Counterparty risk:** The possibility that the counterparty to a transaction may be unwilling or unable to meet its obligations.
- ◆ **Derivatives risk:** Derivatives can behave unexpectedly. The pricing and volatility of many derivatives may diverge from strictly reflecting the pricing or volatility of their underlying reference(s), instrument or asset.
- ◆ **Emerging markets risk:** Emerging markets are less established, and often more volatile, than developed markets and involve higher risks, particularly market, liquidity and currency risks.
- ◆ **Exchange rate risk:** Changes in currency exchange rates could reduce or increase investment gains or investment losses, in some cases significantly.
- ◆ **Investment leverage risk:** Investment leverage occurs when the economic exposure is greater than the amount invested, such as when derivatives are used. A Fund that employs leverage may experience greater gains and/or losses due to the amplification effect from a movement in the price of the reference source.
- ◆ **Liquidity risk:** Liquidity risk is the risk that a Fund may encounter difficulties meeting its obligations in respect of financial liabilities that are settled by delivering cash or other financial assets, thereby compromising existing or remaining investors.
- ◆ **Operational risk:** Operational risks may subject the Fund to errors affecting transactions, valuation, accounting, and financial reporting, among other things.
- ◆ **Style risk:** Different investment styles typically go in and out of favour depending on market conditions and investor sentiment.
- ◆ **Model risk:** Model risk occurs when a financial model used in the portfolio management or valuation processes does not perform the tasks or capture the risks it was designed to. It is considered a subset of operational risk, as model risk mostly affects the portfolio that uses the model.
- ◆ **Sustainability Risk:** Sustainability risk means an environmental, social or governance event or condition that, if it occurs, could cause an actual or a potential material negative impact on the value of the investment.

Global Listed Infrastructure on the defense

Global listed infrastructure (GLI) as a bespoke asset class has seen significant growth over the past decade with funds under management almost tripling¹. We have seen investors allocating to GLI for different reasons such as gaining a defensive building block in equities; for its attractive income potential; and as a liquid exposure to direct infrastructure. In the paper, we will examine why adding GLI could potentially improve the reliance of your investment portfolio, particularly during times of heightened volatility.

Over the last 20 years, GLI and Global Equities (GE) have delivered similar returns, with GLI returning 8.2% (p.a.) and GE delivering 8.4% (p.a.)². However, as seen in the following chart, the two asset classes had different journeys getting there. The volatility for GLI exhibited was lower with an annualised standard deviation of 14.1% whilst GE was at 15.6% during this period.²

Chart 1: Global Listed Infrastructure has delivered similar returns to Global Equities with lower volatility²
(Index 2005=1000)

Infrastructure's resilient cashflows supports its defensive characteristics

Let's explore why this would be the case. Firstly, GLI refers to publicly traded companies which own and/or operate infrastructure assets worldwide. Infrastructure assets encompass public and private physical structures and facilities which are essential for the

stability and growth of any economy as they provide valuable services to society. Due to their critical nature, infrastructure can generate transparent and resilient cash flow as they are usually supported by long-term contracts or regulation. This is exhibited below in the return breakdown of the asset class where GLI has consistently delivered cashflow growth.

Chart 2: Total return breakdown by calendar year³

GLI can provide investors with downside protection

The resilience of infrastructure cashflows supports the defensive characteristics of the asset class. We can see this in the performance of the asset class in the market as GLI has demonstrated an attractive upside / downside capture. As seen in the chart below, when there was an uplift in the broader equities market, GLI only participated in 81% of the rise on average. On the other hand, GLI only captured 65% of the downside historically. This favourable skew during period of downturns shows that GLI can provide downside protection for investors.

Chart 3: Upside vs. downside market capture⁴

³ Source: HSBC AM, Bloomberg. Data from December 2007 to June 2025. Charts represent the HSBC Global Listed Infrastructure Equity Team’s core investment universe. The bars in the charts represent an arithmetic sum whilst the total return is calculated using a geometric sum. Past performance does not predict future returns.

⁴ Source: HSBC AM. Global Listed Infrastructure is represented by the Dow Jones Brookfield Global Infrastructure Index; Global Equities is represented by MSCI World Index; Data period: 31/12/2002 – 31/8/2025. Figures expressed in USD

Let’s dig deeper into this notion of downside protection with real cases. Over the past two decades global equities has experienced a peak-to-trough decline of over 20% during three periods: (1) Global Financial Crisis (GFC) in 2008, (2) COVID-19 lockdowns in 2020, and more recently (3) when global central banks rapidly raised interest rates to combat higher than expected inflation in 2022.

Chart 4: Market drawdowns of over 20% in the past 20 years⁵
(Index 2005=1000)

Peak-to-trough decline	GE	GLI	Difference
2008: GFC	-54.0%	-45.2%	-8.8%

⁵ Source: Bloomberg as of 31 August 2025. Rebased to 2005 levels. Global Listed Infrastructure is represented by the Dow Jones Brookfield Global Infrastructure Index; Global Equities is represented by MSCI World Index Figures in USD

2020: COVID-19	-21.1%	-22.1%	1.0%
2022: Inflation	-25.4%	-22.1%	-3.3%

During two of the three extreme market drawdowns, GLI demonstrated its defensive qualities and provided shelter for investors. Particularly during the GFC, when the market fell 54% and took 68 months to return to its previous peak, GLI only fell 45% and recovered within 40 months, a substantially shorter period. Similarly, in 2022, we saw GLI outperform by 3% when inflation rose, resulting in an increase of interest rates globally. On the other hand, we did see GLI underperform GE by 1% during COVID-19, as lockdown significantly impacted the movement of people and transportation.

GLI can diversify investors global equities exposure

Finally, GLI's lower correlation to GE is supportive for investors allocating from this bucket. Chart 5 shows that on average the rolling 3-year correlation between GLI and GE has been 0.78. This validates the view that GLI can provide diversification benefits to a global equities portfolio.

Chart 5: 3 Year Rolling Correlation⁶

Correlation

In summary, GLI's defensive characteristics can play an important role in well-diversified portfolio. The asset class is supported by resilient cashflow through market cycles and provides investors with an appealing downside protection alongside with a lower correlation to global equities.

Past performance is not a reliable indicator of future performance. Total returns assume the reinvestment of all distributions. The performance is quoted net of all fees and expenses. The reference indices do not incur these costs. This information is provided for general comparative purposes. Positive returns, which the Funds are designed to provide, are different regarding risk and investment profile to index returns.

The value of investments and the income from them can go down as well as up and investors may not get back the amount originally invested. The performance figures contained in this document relate to past performance, which should not be seen as an indication of future returns. Future returns will depend, inter alia, on market conditions, investment manager's skill, risk level and fees. Where overseas investments are held the rate of currency exchange may cause the value of such investments to go down as well as up. Investments in emerging markets are by their nature higher risk and potentially more volatile than those inherent in some established markets. Economies in Emerging Markets generally are heavily dependent upon international trade and, accordingly, have been and may continue to be affected adversely by trade barriers, exchange controls, managed adjustments in relative currency values and other protectionist measures imposed or negotiated by the countries and territories with which they trade. These economies also have been and may continue to be affected adversely by economic conditions in the countries and territories in which they trade.
